

Economy and Environment in Harmony

## Managing waste for a greener environment

Francesco Valentino  
“Cà Foscari” University of Venice

# Circular economy: from waste to resource

## New Circular Economy Action Plan 2020 (EC)

- New focus on **product design phase**

- 2.5 billion tonnes of waste generated each year in EU (EPRS, 2016)
- **Problematic disposal for most of categories** (esp. Sewage sludge and organic fraction of municipal solid waste in urban areas)
- Waste framework directive 2008/98/EC (old)
- Few technologies to recover resources applied as **isolated systems**

# Recovery biodegradable carbon from urban organic waste

**Organic fraction of municipal solid waste (OFMSW)**  
especially from source-sorted collection

**Municipal wastewater**  
major COD portion is then concentrated in **primary and excess sludge (WWS)**

**Park/garden waste**  
not easily biodegradable and more variable with season

**Agro- and food-industry wastewater and waste**  
often produced in proximity to urban areas

- **Streams of «similar» COD composition and from same area, BUT separately handled**

- ✓ different collection systems, different technologies, separate regulations

- **COD is seldom recovered, but for**

- ✓ carbon stabilization as **compost** (soil improvers)

- ✓ energy recovery into **biogas**

- **Limitations**

- ✓ stringent regulation

- ✓ quality (depending on bio-waste collection/treatment)

- ✓ low economic value

# Biorefineries: transforming treatment plants into resource recovery facilities

URBAN CONTEXT

MUNICIPAL Wastewater  
Treatment Plant (WWTP)

SOURCE SORTED WASTE  
= **RENEWABLE SOURCE  
OF CARBON**

+ ADDITIONAL TREATMENT  
STAGES

VIRGIN MATERIALS FROM  
RECOVERED RESOURCES  
e.g. Biofuels, biopolymers, etc.

# Biorefineries: transforming treatment plants into resource recovery facilities

URBAN CONTEXT

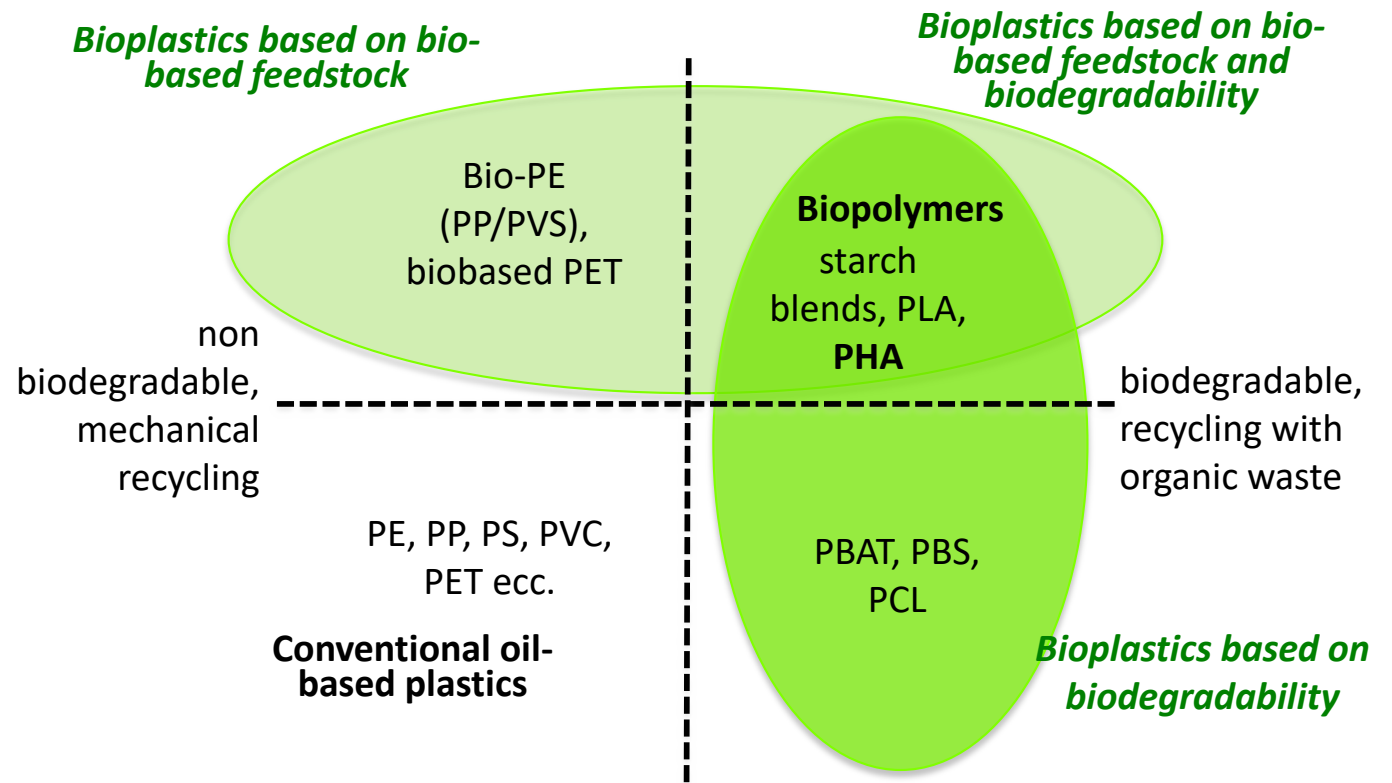

MUNICIPAL Wastewater

+ ADDITIONAL TREATMENT  
STAGES

VIRGIN MATERIALS FROM  
RECOVERED RESOURCES  
e.g. Biofuels, biopolymers, etc.

# Bioplastics portfolio

## GLOBAL PLASTICS MARKET

- Bioplastic market expected to grow at **30% CAGR 2013-2030**
- Traditional plastics expected to grow 3% annually

Bioplastics:  
<1% market share  
\$3.75B

**\$455B**  
2013

4% market share  
\$21B

**\$540B**  
2019

40% market share

**\$803B**  
2030

Bioplastics

Oil-based plastics

Source: Grand View Research 2014, European Bioplastics 2013, BCC Research 2014, Nexant Inc. 2012

- ✓ The **European Strategy for Plastics** asks for decreasing dependency on oil-based plastics, increasing recycle
- ✓ **Bioplastic** market is still very less than oil-based plastics, but much faster growth is expected.

# Why focusing on PHA?

## Product related Pro's

Family of copolymers with tunable composition  
PHA can be the main constituent of several bioplastics, with a wide portfolio of applications.

## Portfolio

- Biodegradable commodity film
- Packaging interlayer film
- Specialty durables (such as electronics)

## Production process Pro's

- A novel open microbial cultures process (not pure strains), to better cope with large heterogeneity of the waste feedstock;
- PHA production process is mostly biological, under mild conditions and reliable.
- Easier integration with existing biological plants for waste and wastewater treatment.

## Appealing

- Produced from renewable feedstock (no food)
- Produced in biological process (no OGM)
- **Biodegradable**: not recycled but virgin material

## Applications and economics

High market potential

As higher as more PHA cost decreases; but still higher value than biogas and compost

Under investigation at TRL 6

# PHA production methods

## Pure culture system (from '70s)

- a) Refine feedstock
- b) Sterilization
- c) Low adaptation to waste treatment

## Mixed Microbial Culture - MMC (from end of '90s)

- a) Waste feedstock
- b) Robustness and adaptability
- c) No sterilization
- d) Integration in existing waste facilities

# Treviso (TV) WWTP ATS S.r.l.

## (Alto Trevigiano Servizi – North East Italy)

OFMSW-Sludge Anaerobic Co-digestion	
Feed characteristics	
Flow, m <sup>3</sup> /d	10 biowaste + 100 sludge
TVS, %TS	70
Operational parameters	
OLR, kgVS/m <sup>3</sup> d	1.5
HRT, d	20-24
Temperature, °C	35-37
Yields	
Biogas, Nm <sup>3</sup> /d	950
Methane, %	60-66
SGP, Nm <sup>3</sup> /kg VS (% biowaste)	0.43

VS removal, %	39

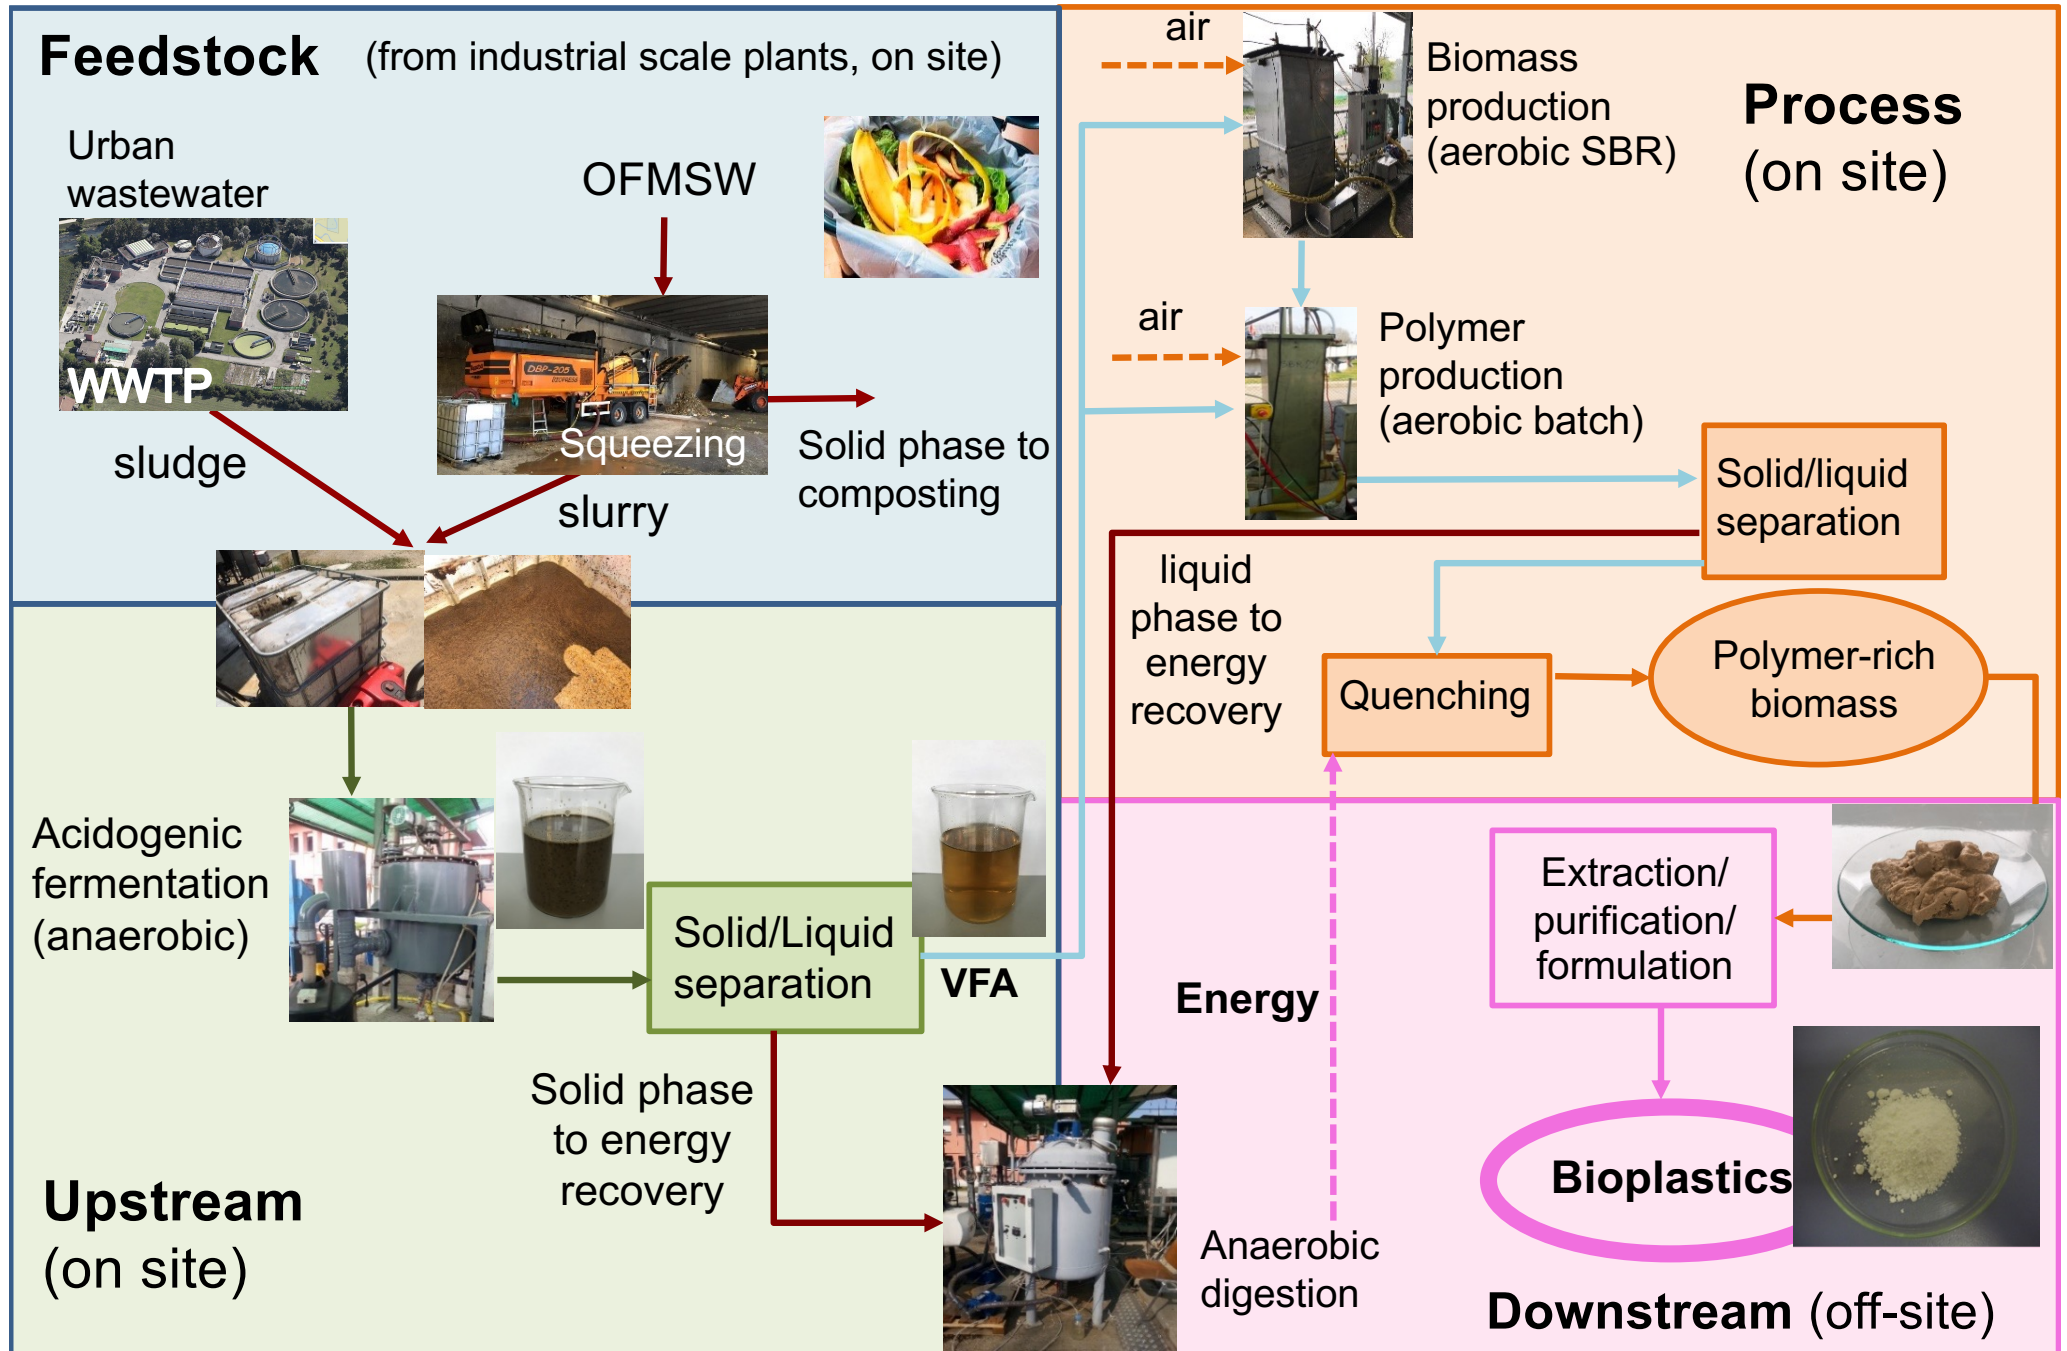

# Pilot Plant Biorefinery for PHA production

# Flow-sheet of biopolymer production from urban biowaste (pilot scale plant in Treviso, Italy)

# Microbial Community (who is behind such efforts)

## FISH image

green: Bacteria (EUB mix probe)

orange: *Hydrogenophaga* cells (HYD208 probe)

80% of total bacteria

Scale bar = 10 µm

## Progress of waste transformation

Food Waste

Sludge

Solid residues  
(to CH<sub>4</sub>)

Liquid stream  
(to PHA)

Biomass  
slurry

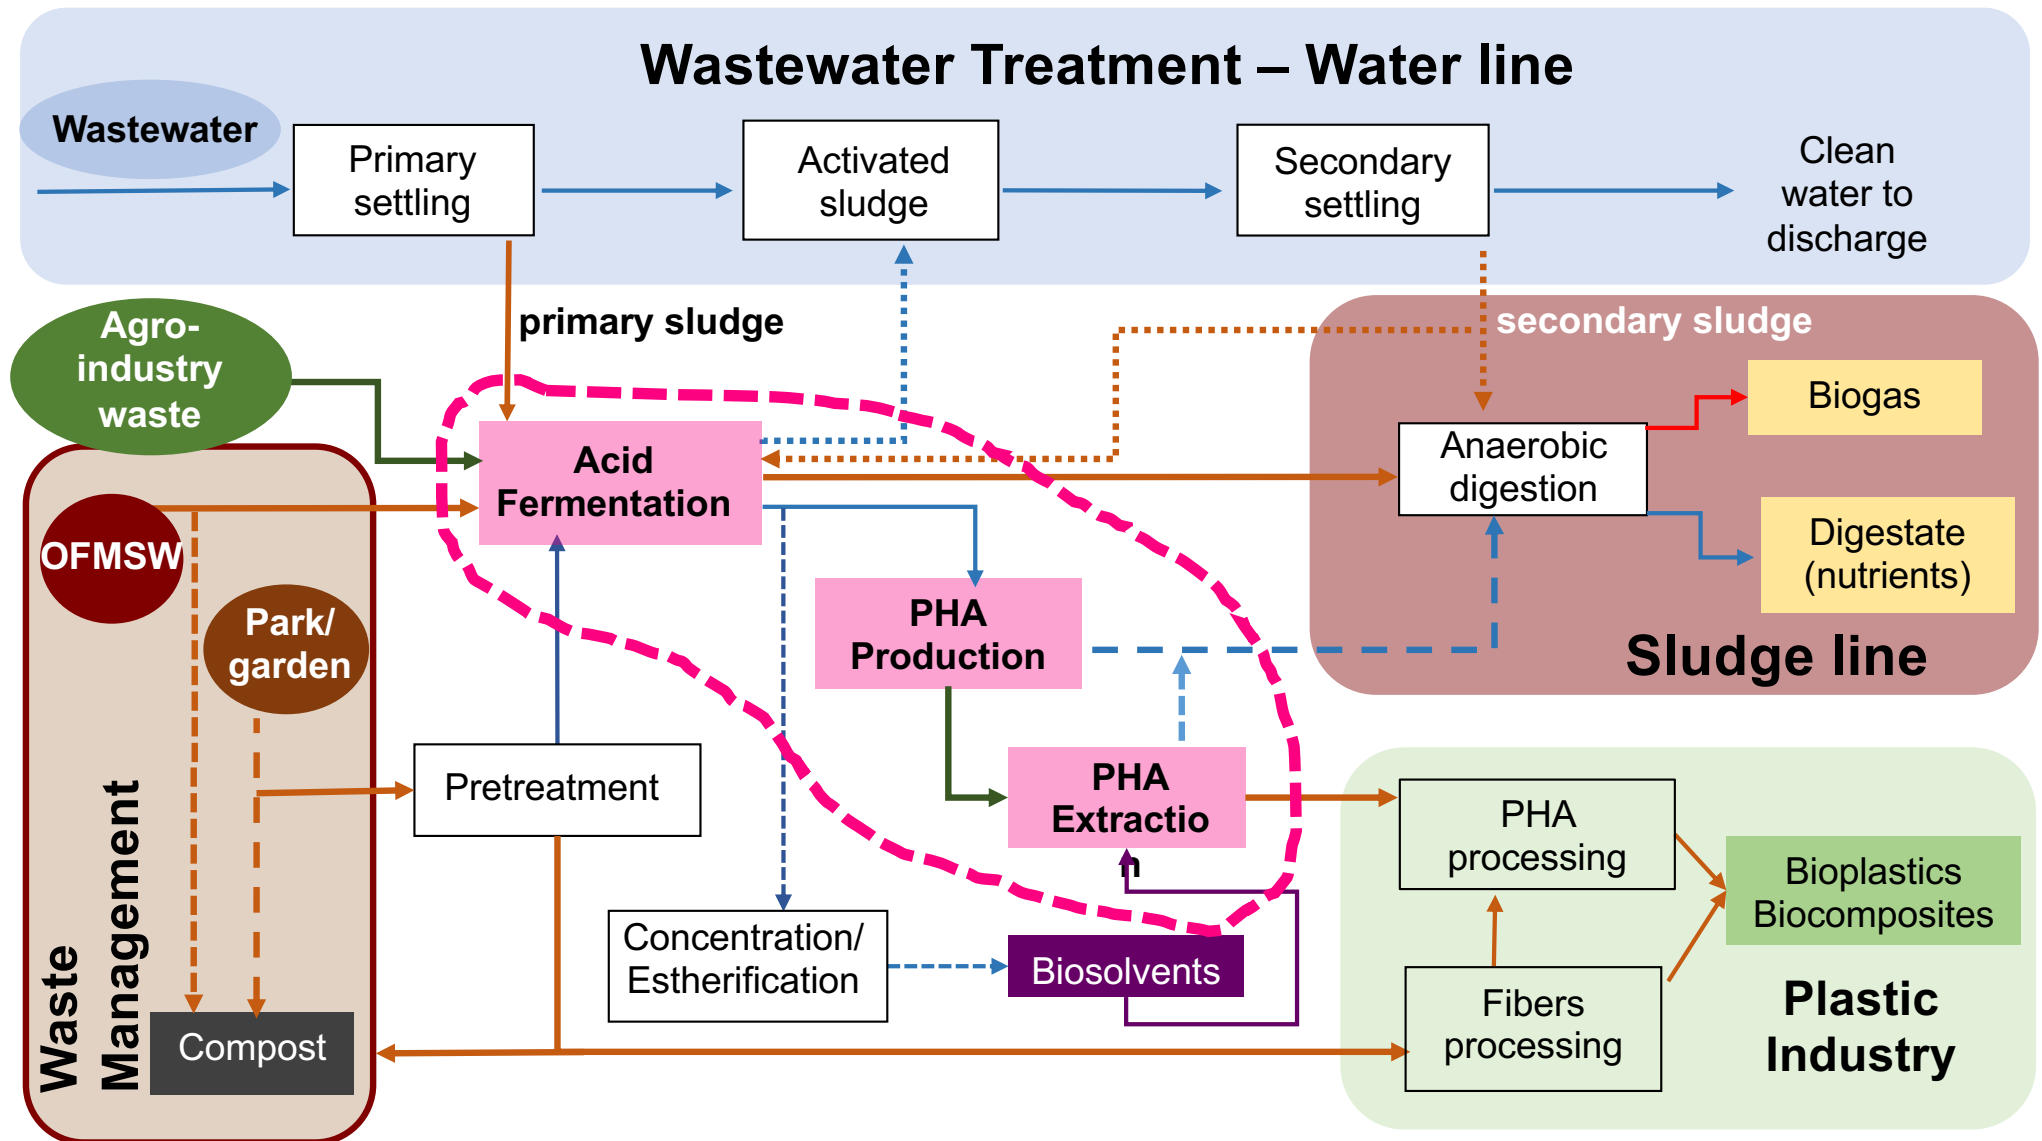

Thickened  
(to PHA  
extraction)

Initial feedstock

Feedstock after upstream  
processes

Feedstock before  
downstream processes

# Linking the urban organic waste biorefinery with existing waste/wastewater treatment facilities and plastic industry

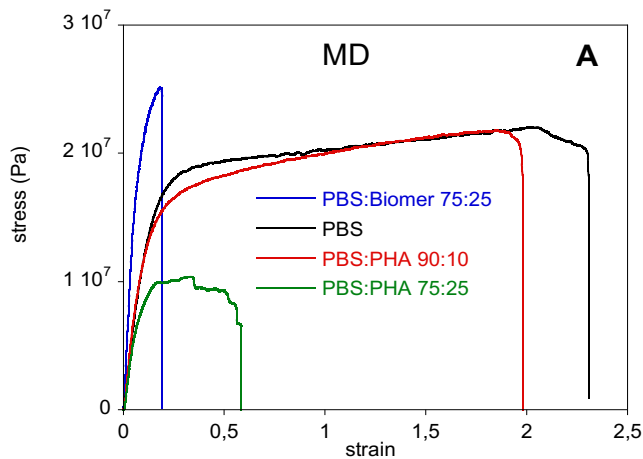

# Main achievements (1)

## Extruder

PHA (granules)

Machanical tests

Film

Blow molding

## Main achievements (2)

PHA compound in pellet (>90% PHA)

Prototypes for mechanical tests

Flexible handle

PHBV compounds with fibers collected from green biowastes

# Main achievements (3)

## Electrospinning

- Multi-layers film for permeability assessment
- Nanoparticles incorporation for properties improvement (active packaging, es. antimicrobial)
- Application as adhesive in substitution of fossil-origin products

EN Horizon 2020 Work Programme 2016 - 2017  
17. Cross-cutting activities - Focus Areas

**CIRC-05-2016: Unlocking the potential of urban organic waste  
Research and Innovation Actions (RIA)**
